CONTENTS

This Test Project proposal consists of the following documentation/files:

1. Instructions
2. MSSQL Data Files
3. MySQL Data Files
4. Data Files

INTRODUCTION

In this session, you will develop a Competition Report System for a food tasting competition for the Philippines Food Festival. Develop a Desktop application as shown in the wireframes (must follow wireframe design) below. The Data files provided are to be used for the application without being amended (i.e. do not add, edit or delete the data).

DELIVERABLES

A food tasting competition was held on 01 August 2025, with participants and judges from various countries invited to promote cultural exchange through cuisine. The date 01 August 2025 will be used as the reference point for all age-related calculations in the system.

The competition consists of multiple rounds of food tasting, with the results of each round being summed to determine the final result. There is therefore a Judging Screen to track the results of the participants across all rounds of the competition. Each round may include a judging session, where judges assign scores; or a voting session, where the public casts votes; or a combination of both sessions (2 in 1). Scoring across different rounds may vary based on the focus of each round. Components deemed more important are assigned higher weights compared to less critical ones. This approach follows a weighted average model, calculated using the following formula:

$$W = \frac{\sum_{i=1}^{n} w_i \text{ x } s_i}{n}$$

where W is the weighted score, w_i is the weight of component i, s_i is the score of component, n is the number of components with non-zero weights. If a component has a weight of 0, it is excluded from the weighted score calculation. All weighted scores should be calculated to two decimal places.

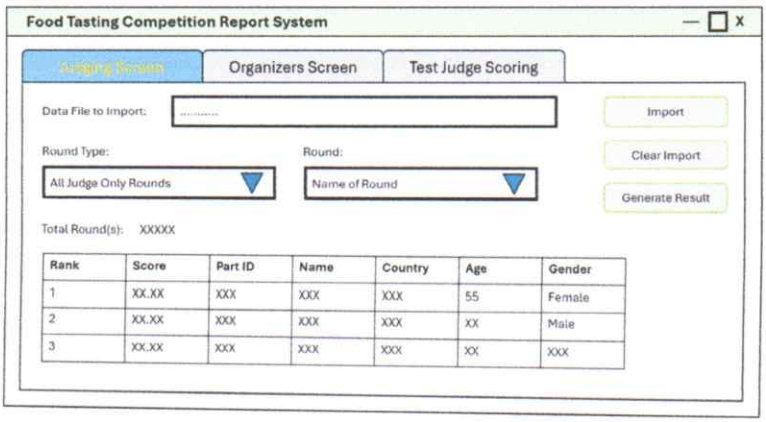
Judges will score participants based on three components' criteria: Taste, Creativity, and Presentation. Each component is assigned a specific weight—Wt for Taste, Wc for Creativity, and Wp for Presentation. The weighted score for a participant by each judge is calculated using these weights applying the weighted average model. A participant score for a judging session is the average score from all judges rounded to 2 decimal places. Public voting is conducted to allow the public to rank their top three favourite dishes (participants). Points are awarded to each participant based on their ranking in the votes. The total accumulated points determine the participant's score for that voting session.

Each round's scoring may include a judging session, or a voting session, or both (2 in 1). The final score for a round is also calculated using the weighted average model, where Wj represents the weight of the judging session score, and Wv represents the weight of the voting session score.



All judging and voting data are contained in the provided data file. The application must include an "Import" function that allows the user to select the data file and import its contents into the database. The import function should validate the data file content. If an invalid file (not having all tables as the provided data file) is selected, display a message box showing "invalid data file selected". If a valid file is selected, save the data into database and also display the path and the data filename at "Data File to Import" area. After the data is saved into the database, display a message box indicating total number of database rows imported. There is also a "Clear Import" function which deletes all imported data, clears all the results and clear the "Data file to import" area. Do not clear the data from the Role, UserInfo and UserRole tables.

Perform the "Clear Import" before the "Import". The "Generate Result" is used to process and display the overall score results (follow screen format) based on the selected options at the dropdown lists. Available options at "Round Type" dropdown list are : "All Judge Only Rounds", "All Vote Only Rounds", "All 2 in 1 Only Rounds", and "All Rounds" with "All Rounds" being the default option. The default option for "Round" dropdown list is "All Relevant Rounds" and the remaining options are the specific Round Description(s) relevant to the "Round Type" selection. Results must be ranked by overall score from all applicable rounds in descending order and only first 12 records are displayed. In the case of a tie, participants should be sorted by Country (ascending), then Age (descending), and finally Name (ascending). Rankings should follow the standard competition ranking system: tied participants share the same rank, and subsequent ranks are skipped accordingly. The application should also indicate total rounds of results processed based on both the dropdown list settings. If there is no data in the database and "Generate Result" is clicked, the dropdown list options and result should still reflect appropriately. The dropdown list should reset to default option when "Import" or "Clear Import" is clicked.

The organizers would also like to generate a personal summary certificate for each participant in the competition. This will enable them to better track the individual performance of each participant at one glance. This certificate will also provide the participant with a consolidated overview of their performance during the competition. This Organizers Screen should allow the user to select the participant's name from a dropdown list whose data is extracted dynamically from the database (default to 1st entry, sorted by name in ascending order). Based on the selected participant, the screen should show their profile picture and country flag. It should also display their date of birth (follow screen for date format), gender, scores and ranks for each of the rounds of the competition. For overall performance, it displays overall score and overall rank for all rounds. The overall rank is displayed in few perspectives based on all participants, all participants within same Country and all participants within same Gender. Refer above for how to calculate their score and rank for each type of round. Finally, it should also show the total number of public votes that they received for all the "All Vote Only" rounds. If there are more than one "All Vote Only" rounds in the competition, it should display the combined total number of votes from all of the rounds.

A Test Judge Scoring Tab Page is designed for testing and validating the weighted score calculation. It should allow user to input the weights and scores for all components and display the resulting computed weighted score. Additionally, the page should provide the option to select an existing score record from the database, loading its component weights and scores values into the page. This page is intended solely for testing and verification — it does not modify any data in the database. Please design the page according to the specified requirements
